(54) Title: HUMAN TELOMERASE

(57) Abstract

The invention provides methods and compositions relating to a human telomerase and related nucleic acids, including four distinct human telomerase subunit proteins called p140, p105, p48 and p43 having human telomerase-specific activity. The proteins may be produced recombinantly from transformed host cells from the disclosed telomerase encoding nucleic acids or purified from human cells. Also included are human telomerase RNA components, as well as specific, functional derivatives thereof. The invention provides isolated telomerase hybridization probes and primers capable of specifically hybridizing with the disclosed telomerase gene, telomerase-specific binding agents such as specific antibodies, and methods of making and using the subject compositions in diagnosis, therapy and in the biopharmaceutical industry.

Human Telomerase

INTRODUCTION

Field of the Invention

The field of this invention is an enzyme involved in cell replication.

5

Background

DNA at chromosome ends is maintained in a dynamic balance of loss and addition of telomeric simple sequence repeats. Sequence loss occurs during cell replication, in part from incomplete replication of chromosome termini by DNA-dependent DNA polymerase. Telomeric repeat addition is catalyzed by the enzyme telomerase: a ribonucleoprotein enzyme which uses a short region within the RNA as a template for the polymerase reaction. Although cells can maintain a constant number of telomeric repeats by balancing repeat loss and addition, not all cells do so. Human germline and cancer cells maintain a constant number of telomeric repeats, while normal human somatic cells lose telomeric repeats with each cycle of cell division. Cells which do not maintain stable telomere length demonstrate a limited proliferative capacity: these cells senesce after a number of population doublings correlated with the erosion of telomeres to a critical minimum length.

10

Because normal somatic cells do not appear to express or require telomerase and do not maintain chromosome ends, and because all or almost all cancer cells express high levels of telomerase activity and maintain chromosome ends, molecules that inhibit or alter telomerase activity could provide effective and non-toxic anti-cancer agents. Similarly, inhibition of telomerase in parasitic or infectious agents (e.g. trypanosomes, fungi, etc.) could provide a specific approach for reducing the viability or proliferation of these agents.

15

20

Conversely, activation of telomerase in proliferation-restricted cells (such as normal somatic cells of the blood, vasculature, liver, skin, etc.) could provide a mechanism for promoting additional proliferative lifespan.

Relevant Literature

5 Purification of telomerase from the ciliate *Tetrahymena* and cloning of genes encoding two protein components of the enzyme is reported in Collins et al. (1995) *Cell* 81, 677-686 and copending US patent application No. 08/359,125, filed 19 DEC 1994. Literature relating to human telomerase include; Kim et al. (1994) *Science* 266, 2011-2014; and Feng et al. (1995) *Science* 269, 1236-1241. Literature relating to telomerase template
10 modifications include Autexier et al. (1994) *Genes and Devel* 8, 563-575; Yu et al. (1991) *Cell* 67, 823-832; and Yu et al. (1990) *Nature* 344, 126-132. The Washington University-Merck EST Project contains an EST, reportedly deposited by Hillier et al. on Nov 1, 1995, which has sequence similarity with the 3' end of SEQ ID NO:3, disclosed herein. For a
15 general review, see Blackburn et al., Eds. (1995) *Telomeres*, Cold Spring Harbor Laboratory Press.

SUMMARY OF THE INVENTION

20 The invention provides methods and compositions relating to a human telomerase and related nucleic acids. Included are four distinct human telomerase subunit proteins, called p140, p105, p48 and p43 and telomerase protein domains thereof having telomerase-specific activity. The proteins may be produced recombinantly from transformed host cells from the subject telomerase encoding nucleic acids or purified from human cells. Also included are human telomerase RNA components, as well as specific, functional derivatives thereof.

25 The invention provides isolated telomerase hybridization probes and primers capable of specifically hybridizing with the disclosed telomerase gene, telomerase-specific binding agents such as specific antibodies, and methods of making and using the subject compositions in diagnosis (e.g. genetic hybridization screens for telomerase transcripts), therapy (e.g. gene therapy to modulate telomerase gene expression) and in the
30 biopharmaceutical industry (e.g. reagents for screening chemical libraries for lead pharmacological agents and nucleic acid polymerase reagents).

SEQ ID LISTING

- SEQ ID NO:1: p105 protein (amino acid sequence)
SEQ ID NO:2: p105 ambiguity maximized synthetic DNA
SEQ ID NO:3: p105 natural cDNA (the coding region is bp 97-2370)
SEQ ID NO:4: p105 E. coli optimized synthetic DNA
5 SEQ ID NO:5: p105 mammalian optimized synthetic DNA
SEQ ID NO:6: telomerase RNA
SEQ ID NO:7: telomerase RNA template region modification 1
SEQ ID NO:8: telomerase RNA template region modification 2
SEQ ID NO:9: telomerase RNA template region modification 3
10 SEQ ID NO:10 p43 peptide (XXXEAAT[L/L]D[L/L]PQQGANK, where the three X's are
indeterminant residues)

DETAILED DESCRIPTION OF THE INVENTION

15 The invention provides isolated human telomerase proteins including human
telomerase proteins p140, p105, p48 and p43, having molecular weights of about 140kD,
about 105kD, about 48kD and about 43kD, respectively, as determined by polyacrylamide
gel electrophoresis under denaturing conditions (Matsudaira and Burgess (1978) Anal
Biochem 87, 386-396), and telomerase protein domains thereof. The telomerase proteins
comprise assay-discernable functional domains including RNA recognition motifs and
20 subunit binding domains and may be provided as fusion products, e.g. with non-telomerase
polypeptides. The human telomerase proteins of the invention, including the subject protein
domains, all have telomerase-specific activity or function.

Telomerase-specific activity or function may be determined by convenient *in vitro*,
cell-based, or *in vivo* assays: e.g. *in vitro* binding assays, cell culture assays, in animals (e.g.
25 immune response, gene therapy, transgenics, etc.), etc. Binding assays encompass any
assay where the molecular interaction of a telomerase protein with a binding target is
evaluated. The binding target may be a natural intracellular binding target such as a
telomerase subunit (e.g. another protein subunit or RNA subunit), a substrate, agonist,
antagonist, chaperone, or other regulator that directly modulates telomerase activity or its
30 localization; or non-natural binding target such a specific immune protein such as an
antibody, or a telomerase specific agent such as those identified in assays described below.

Generally, telomerase-binding specificity is assayed by telomere polymerase activity (see, e.g. Collins et al. 1995, Cell 81, 677-686), by binding equilibrium constants (usually at least about 10^{-7} M^{-1} , preferably at least about 10^8 M^{-1} , more preferably at least about 10^9 M^{-1}), by the ability of the subject protein to function as negative mutants in telomerase-expressing cells, to elicit telomerase specific antibody in a heterologous host (e.g. a rodent or rabbit), etc. In any event, the telomerase binding specificity of the subject telomerase proteins necessarily distinguishes ciliate telomerase, preferably distinguishes non-mammalian telomerases and more preferably distinguishes non-human telomerases. Exemplary telomerase proteins which are shown to have telomerase binding specificity include the telomerase RNA (e.g. SEQ ID NO:6) binding domains (e.g. RRM 1-4: SEQ ID NO:1, about residues 5-81, residues 115-192, residues 336-420, and residues 487-578, respectively), telomerase primer binding domains, nucleotide triphosphate binding domains and binding domains of regulators of telomerase such as nuclear localization proteins, etc. As used herein, a protein domain comprises at least 12, preferably at least about 20, more preferably at least about 40, most preferably at least about 80 residues of the disclosed respective SEQ ID NO.

The claimed human telomerase proteins are isolated or pure: an "isolated" protein is unaccompanied by at least some of the material with which it is associated in its natural state, preferably constituting at least about 0.5%, and more preferably at least about 5% by weight of the total protein in a given sample and a pure protein constitutes at least about 90%, and preferably at least about 99% by weight of the total protein in a given sample. The telomerase proteins and protein domains may be synthesized, produced by recombinant technology, or purified from human cells. A wide variety of molecular and biochemical methods are available for biochemical synthesis, molecular expression and purification of the subject compositions, see e.g. Molecular Cloning, A Laboratory Manual (Sambrook, *et al.* Cold Spring Harbor Laboratory), Current Protocols in Molecular Biology (Eds. Ausubel, *et al.*, Greene Publ. Assoc., Wiley-Interscience, NY) or that are otherwise known in the art. An exemplary method for isolating each of human telomerase protein p140, p105, p48 and p43 from human cells is as follows:

Several thousand (two to twelve thousand) liters of HeLa cells are grown in spinner culture. The cells are lysed by dounce homogenization in low-salt buffer to produce crude cell lysates. The lysates are supplemented with 15% glycerol and centrifuged at 125,000 x

g for 50 minutes to obtain a first soluble fraction enriched for telomerase activity (S-100 fraction). The S-100 fraction is adjusted to 0.2 M ammonium sulfate, bound to SP Sepharose (Pharmacia), and developed with a gradient in sodium chloride, to obtain a second soluble fraction enriched for telomerase (SP fraction). The SP fraction is adjusted to about 0.3-0.4 M ionic strength and bound to Q Sepharose (Pharmacia), and developed with a gradient in sodium chloride, to obtain a third soluble fraction enriched for telomerase (Q fraction). The Q fraction is adjusted to about 0.3-0.4 M ionic strength, bound to phosphocellulose (Whatman), and developed with sodium chloride, to obtain a fourth soluble fraction enriched for telomerase (PC fraction). The PC fraction is adjusted to about 0.3-0.4 M ionic strength, bound to 2'Omethyl RNA oligonucleotide immobilized on streptavidin agarose (Sigma), and eluted with a electrophoresis sample medium comprising 5% β -mercaptoethanol and 2% Sodium Dodecyl Sulfate to obtain a fifth soluble fraction (2'Omethyl fraction). The 2'Omethyl fraction is separated by polyacrylamide gel electrophoresis under denaturing conditions (Matsudaira and Burgess (1978) Anal Biochem 87, 386-396) to obtain gel protein bands at a molecular weight of about 140kD, 105kD, 48kD or 43kD having telomerase activity. The gel bands are excised or blotted to obtain purified human telomerase proteins p140, p105, p48 and p43.

The subject telomerase proteins find a wide variety of uses including use in isolating, enriching for and concentrating telomerase RNA and telomerase proteins, as immunogens, in the methods and applications described below, as reagents in the biotechnology industries, and in therapy. Recombinant telomerases are used in many applications where nascent oligonucleotides of predetermined sequence are desired. For example, native nucleic acid molecules are labeled or extended at their 3' ends by addition of a predetermined repeat sequence (for double-stranded oligonucleotides, both ends of the molecule may be tagged). Oligonucleotides complementary to the repeat are then used to amplify, sequence, affinity purify, etc. the nucleic acid molecules. The use of a repeat sequence for 3' end tagging improves specificity and provides sequence alternatives compared with non-templated enzymes presently available for this purpose, e.g. terminal transferase. Repeats encoding restriction enzyme sites provide repeat tagging to facilitate cloning and the use of telomerase alleviates the restrictive conditions required for optimal ligation with available ligase enzymes. Telomerase also finds use in regulating cell growth

or increasing cell density tolerance; for example, cells contacted with an effective amount of exogenous telomerase to overcome the growth control limitation otherwise imposed by short telomere length. Telomerase may be introduced, expressed, or repressed in specific populations of cells by any convenient way such as microinjection, promoter-specific expression of recombinant enzyme, targeted delivery of lipid vesicles, etc. Advantageously, only a brief period of telomerase activity is required to allow many generations of continued proliferation of the contacted cell, due to the ability of telomerase to extend telomeres in one cell cycle by more sequence than is lost with each cell division.

The invention provides natural and non-natural human telomerase-specific binding agents including substrates, agonist, antagonist, etc., methods of identifying and making such agents, and their use in diagnosis, therapy and pharmaceutical development. For example, human telomerase-specific agents are useful in a variety of diagnostic and therapeutic applications. Novel human telomerase-specific binding agents include human telomerase-specific receptors, such as somatically recombined protein receptors like specific antibodies or T-cell antigen receptors (see, e.g. Harlow and Lane (1988) Antibodies, A Laboratory Manual, Cold Spring Harbor Laboratory) and other natural intracellular binding agents identified with assays such as one-, two- and three-hybrid screens, non-natural intracellular binding agents identified in screens of chemical libraries such as described below, etc. Agents of particular interest modulate human telomerase function, e.g. human telomerase antagonists and find use methods for modulating the binding of a human telomerase or telomerase protein to a human telomerase binding target.

For diagnostic uses, the binding agents are frequently labeled, such as with fluorescent, radioactive, chemiluminescent, or other easily detectable molecules, either conjugated directly to the binding agent or conjugated to a probe specific for the binding agent. Binding agents also find use in modulating the telomerase activity present in a cell. For example, isolated cells, whole tissues, or individuals may be treated with a telomerase binding agent to activate, inhibit, or alter the specificity of telomerase assembly, localization, substrate interaction, or synthesis activity. Effectively treated cells have increased or decreased replication potential, or suffer from loss of proper telomere structure (resulting in lethality). These binding agents also find therapeutic use to control cell proliferation; for example, the uncontrolled growth of transformed cells (e.g. cancer cells) is managed by administration to the cells or patient comprising such cells of a telomerase

binding agent which reduces telomerase activity. In contrast to many current chemotherapies, the present invention provides enhanced specificity of lethality, with minimum toxicity to dividing yet normal somatic cells.

The amino acid sequences of the disclosed telomerase proteins are used to back-translate telomerase protein-encoding nucleic acids optimized for selected expression systems (Holler et al. (1993) Gene 136, 323-328; Martin et al. (1995) Gene 154, 150-166) or used to generate degenerate oligonucleotide primers and probes for use in the isolation of natural telomerase encoding nucleic acid sequences ("GCG" software, Genetics Computer Group, Inc, Madison WI). As examples, SEQ ID NO:2 discloses an ambiguity-maximized p105 coding sequence encompassing all possible nucleic acids encoding the full-length p105 protein. SEQ ID NO:3 discloses a natural human cDNA sequence encoding p105, SEQ ID NO:4 is a p105 coding sequence codon-optimized for *E. coli*, SEQ ID NO:5 is a p105 coding sequence codon optimized for mammalian cell expression. Telomerase encoding nucleic acids may be part of human telomerase-expression vectors and may be incorporated into recombinant host cells, e.g. for expression and screening, transgenic animals, e.g. for functional studies such as the efficacy of candidate drugs for disease associated with human telomerase-mediated signal transduction, etc. Expression systems are selected and/or tailored to effect human telomerase protein structural and functional variants through alternative post-translational processing.

The invention also provides nucleic acid hybridization probes and replication/amplification primers having a human telomerase cDNA specific sequence contained in SEQ ID NO:3, bases 1-2345, and sufficient to effect specific hybridization thereto (i.e. specifically hybridize with SEQ ID NO:3, bases 1-2345 in the presence of natural ciliate telomerase cDNA, preferably in the presence of non-mammalian telomerase cDNA and more preferably, in the presence of murine telomerase cDNA). Demonstrating specific hybridization generally requires stringent conditions, for example, hybridizing in a buffer comprising 30% formamide in 5 x SSPE (0.18 M NaCl, 0.01 M NaPO₄, pH7.7, 0.001 M EDTA) buffer at a temperature of 42°C and remaining bound when subject to washing at 42°C with 0.2 x SSPE; preferably hybridizing in a buffer comprising 50% formamide in 5 x SSPE buffer at a temperature of 42°C and remaining bound when subject to washing at 42°C with 0.2 x SSPE buffer at 42°C. Human telomerase cDNA homologs can also be distinguished from other protein using alignment algorithms, such as BLASTX (Altschul *et*

al. (1990) Basic Local Alignment Search Tool, J Mol Biol 215, 403-410).

The invention also provides non-natural sequence, recombinant and isolated natural sequence human telomerase RNA. Natural human telomerase RNA sequences include the nucleic acid disclosed as SEQ ID NO:6, or a fragment thereof sufficient to specifically hybridize with a nucleic acid having the sequence defined by SEQ ID NO:6 in the presence of a nucleic acid having the sequence disclosed in Feng et al. 1995, Science 269, 1236-1241. Such fragments necessarily distinguish the previously described (Feng et al. 1995, Science 269, 1236-1241) human RNA species. Preferred such fragments comprise SEQ ID NO:6, bases 191-210, bases 245-259, bases 341-369 or bases 381-399. Non-natural sequences include derivatives and/or mutations of SEQ ID NO:6, where such derivatives/mutations provide alteration in template, protein binding, or other regions to effect altered telomerase substrate specificity or altered reaction product (e.g. any predetermined sequence), etc.; see, e.g. Autexier et al., 1994, Genes & Develop 8, 563-575; Collins et al. (1995) EMBO J. 14, 5422-5432; Greider et al. (1995) Structure and Biochemistry of Ciliate and Mammalian Telomerases, in DNA Replication, DePamphilis, Ed., Cold Spring Harbor Laboratory Press. Additional derivatives function as dominant negative fragments which effectively compete for telomerase assembly. For examples, SEQ ID NO:7, 8 and 9 are derivatives which provide for modified substrate specificity and polymerase reaction product to interfere with cellular function (see, e.g. Hanish et al. (1994) Proc Natl Acad Sci 91, 8861-8865).

The subject nucleic acids are of synthetic/non-natural sequences and/or are isolated, i.e. unaccompanied by at least some of the material with which it is associated in its natural state, preferably constituting at least about 0.5%, preferably at least about 5% by weight of total nucleic acid present in a given fraction, and usually recombinant, meaning they comprise a non-natural sequence or a natural sequence joined to nucleotide(s) other than that which it is joined to on a natural chromosome. Nucleic acids comprising the nucleotide sequence of SEQ ID NO:3 or fragments thereof, contain such sequence or fragment at a terminus, immediately flanked by a sequence other than that which it is joined to on a natural chromosome, or flanked by a native flanking region fewer than 10 kb, preferably fewer than 2 kb, which is immediately flanked by a sequence other than that which it is joined to on a natural chromosome. While the nucleic acids are usually RNA or DNA, it is often advantageous to use nucleic acids comprising other bases or nucleotide analogs to

provide modified stability, etc. The subject nucleic acids find a wide variety of applications including use as translatable transcripts, hybridization probes, PCR primers, diagnostic nucleic acids, etc.; use in detecting the presence of human telomerase genes and gene transcripts and in detecting or amplifying nucleic acids encoding additional human telomerase homologs and structural analogs.

5 In diagnosis, human telomerase hybridization probes find use in identifying wild-type and mutant human telomerase alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses. In therapy, therapeutic human telomerase nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active
10 telomerase. A wide variety of indications may be treated, either prophylactically or therapeutically with the subject compositions. For example, where limitation of cell growth is desired, e.g. neoproliferative disease, a reduction in telomerase expression is effected by introducing into the targeted cell type human telomerase nucleic acids which reduce the functional expression of human telomerase gene products (e.g. nucleic acids capable of
15 inhibiting translation of a functional telomerase transcript). Conditions for treatment include various cancers, where any of a wide variety of cell types may be involved, restenosis, where vascular smooth muscle cells are involved, inflammatory disease states, where endothelial cells, inflammatory cells and glomerular cells are involved, myocardial infarction, where heart muscle cells are involved, glomerular nephritis, where kidney cells
20 are involved, transplant rejection where endothelial cells are involved, infectious diseases such as HIV infection where certain immune cells and other infected cells are involved, or the like.

Telomerase inhibitory nucleic acids are typically antisense: single-stranded sequences comprising complements of the disclosed natural telomerase coding sequences.
25 Antisense modulation of the expression of a given telomerase protein may employ telomerase antisense nucleic acids operably linked to gene regulatory sequences. Cells are transfected with a vector comprising a human telomerase sequence with a promoter sequence oriented such that transcription of the gene yields an antisense transcript capable of binding to endogenous human telomerase protein encoding mRNA. Transcription of the
30 antisense nucleic acid may be constitutive or inducible and the vector may provide for stable extrachromosomal maintenance or integration. Alternatively, single-stranded

antisense nucleic acids that bind to genomic DNA or mRNA encoding a given human telomerase protein may be administered to the target cell, in or temporarily isolated from a host, at a concentration that results in a substantial reduction in expression of the targeted protein.

5 In other indications, e.g. certain hypersensitivities, atrophic diseases, etc., an increase in cell growth or proliferation is desired. In these applications, an enhancement in human telomerase expression is effected by introducing into the targeted cell type human telomerase nucleic acids which increase the functional expression of human telomerase gene products. Conditions for treatment include multiple sclerosis, where certain neuronal cells are involved, inflammatory disease states such as rheumatoid arthritis, where
10 bystander cells are involved, transplant rejection where graft cells are involved, infectious diseases such as HIV infection where certain uninfected host cells are involved, or the like. Such nucleic acids may be human telomerase expression vectors, vectors which upregulate the functional expression of an endogenous human telomerase allele, or replacement vectors for targeted correction of human telomerase mutant alleles.

15 Various techniques may be employed for introducing of the nucleic acids into viable cells, e.g. transfection with a retrovirus, viral coat protein-liposome mediated transfection. The techniques vary depending upon whether one is using the subject compositions in culture or *in vivo* in a host. In some situations it is desirable to provide the nucleic acid source with an agent which targets the target cells, such as an antibody specific for a surface
20 membrane protein on the target cell, a ligand for a receptor on the target cell, etc. Where liposomes are employed, proteins which bind to a surface membrane protein associated with endocytosis may be used for targeting and/or to facilitate uptake, e.g. capsid proteins or fragments thereof tropic for a particular cell type, antibodies for proteins which undergo internalization in cycling, proteins that target intracellular localization and enhance
25 intracellular half-life.

30 The invention provides methods and compositions for enhancing the yield of many recombinantly produced proteins by increasing maximum cell densities and survival time of host production cells in culture. Specifically, cultured cells are transfected with nucleic acids which effect the up-regulation of endogenous telomerase or the expression of an exogenous telomerase. For example, nucleic acids encoding functional human telomerase operably linked to a transcriptional promoter are used to over-express the exogenous

telomerase in the host cell. Telomerase-expressing cells demonstrate enhanced survival ability at elevated cell densities and over extended culture periods.

The invention provides efficient methods of identifying agents, compounds or lead compounds for agents active at the level of a human telomerase modulatable cellular function. Generally, these screening methods involve assaying for compounds which modulate human telomerase interaction with a natural human telomerase binding target. A wide variety of assays for binding agents are provided including labeled in vitro telomere polymerase assays, protein-protein binding assays, immunoassays, cell based assays, etc. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for lead compounds. Identified reagents find use in the pharmaceutical industries for animal and human trials; for example, the reagents may be derivatized and rescreened in *in vitro* and *in vivo* assays to optimize activity and minimize toxicity for pharmaceutical development. Target indications may include infection, genetic disease, cell growth and regulatory disfunction, such as neoplasia, inflammation, hypersensitivity, etc. Target cells also include progenitor cells for repopulating blood or bone marrow, tissue grafts, and tissue subject to degradation/high turnover such as digestive and vascular endothelia and pulmonary and dermal epithelia.

In vitro binding assays employ a mixture of components including a human telomerase protein, which may be part of multi-subunit telomerase, a fusion product with another peptide or polypeptide, e.g. a tag for detection or anchoring, etc. The assay mixtures comprise a natural intracellular human telomerase binding target, e.g. a substrate. While native binding targets may be used, it is frequently preferred to use portions (e.g. peptides, nucleic acid fragments) thereof so long as the portion provides binding affinity and avidity to the subject human telomerase conveniently measurable in the assay. The assay mixture also comprises a candidate pharmacological agent. Candidate agents encompass numerous chemical classes, though typically they are organic compounds; preferably small organic compounds and are obtained from a wide variety of sources including libraries of synthetic or natural compounds. A variety of other reagents may also be included in the mixture. These include reagents like salts, buffers, neutral proteins, e.g. albumin, detergents, protease inhibitors, nuclease inhibitors, antimicrobial agents, etc. may be used.

The resultant mixture is incubated under conditions whereby, but for the presence of

the candidate pharmacological agent, the human telomerase specifically binds the cellular binding target, portion or analog with a reference binding affinity. The mixture components can be added in any order that provides for the requisite bindings and incubations may be performed at any temperature which facilitates optimal binding. Incubation periods are likewise selected for optimal binding but also minimized to facilitate rapid, high-throughput screening.

After incubation, the agent-biased binding between the human telomerase and one or more binding targets is detected by any convenient way. For cell-free binding type assays, a separation step is often used to separate bound from unbound components. Separation may be effected by precipitation (e.g. TCA precipitation, immunoprecipitation, etc.), immobilization (e.g. on a solid substrate), etc., followed by washing by, for examples, membrane filtration (e.g. Whatman's P-81 ion exchange paper, Polyfiltronic's hydrophobic GFC membrane, etc.), gel chromatography (e.g. gel filtration, affinity, etc.). For telomere polymerase assays, binding is detected by a change in the polymerization by the telomerase of a nucleic acid or nucleic acid analog on the substrate.

Detection may be effected in any convenient way. For cell-free binding assays, one of the components usually comprises or is coupled to a label. The label may provide for direct detection as radioactivity, luminescence, optical or electron density, etc. or indirect detection such as an epitope tag, an enzyme, etc. A variety of methods may be used to detect the label depending on the nature of the label and other assay components, e.g. through optical or electron density, radiative emissions, nonradiative energy transfers, etc. or indirectly detected with antibody conjugates, etc.

A difference in the binding affinity of the human telomerase protein to the target in the absence of the agent as compared with the binding affinity in the presence of the agent indicates that the agent modulates the binding of the human telomerase protein to the human telomerase binding target. Analogously, in the cell-based transcription assay also described below, a difference in the human telomerase transcriptional induction in the presence and absence of an agent indicates the agent modulates human telomerase-induced transcription. A difference, as used herein, is statistically significant and preferably represents at least a 50%, more preferably at least a 90% difference.

The following examples are offered by way of illustration and not by way of limitation.

EXAMPLES

1. Protocol for high-throughput human telomere polymerization assay.

A. Reagents:

- Neutralite Avidin: 20 $\mu\text{g/ml}$ in PBS.

- human telomerase: 10^{-8} - 10^{-5} M human telomerase in PBS.

- Blocking buffer: 5% BSA, 0.5% Tween 20 in PBS; 1 hour at room temperature.

- Assay Buffer: 100 mM KCl, 20 mM HEPES pH 7.6, 1 mM MgCl_2 , 1 mM dATP, 1 mM dTTP, 1% glycerol, 0.5% NP-40, 50 mM BME, 1 mg/ml BSA, cocktail of protease inhibitors.

- $[\text{}^{32}\text{P}]\alpha\text{-dGTP}$ 10x stock: 2×10^{-5} M "cold" dGTP with 100 μCi $[\text{}^{32}\text{P}]\alpha\text{-dGTP}$.

Place in the 4°C microfridge during screening.

- telomerase substrate: 10^{-7} - 10^{-4} M biotinylated telomerase substrate (5'-biotin-d(TTAGGG)₃-3') in PBS.

- Protease inhibitor cocktail (1000X): 10 mg Trypsin Inhibitor (BMB # 109894), 10 mg Aprotinin (BMB # 236624), 25 mg Benzamidine (Sigma # B-6506), 25 mg Leupeptin (BMB # 1017128), 10 mg APMSF (BMB # 917575), and 2mM NaVO_3 (Sigma # S-6508) in 10 ml of PBS.

B. Preparation of assay plates:

- Coat with 120 μl of stock N Avidin per well overnight at 4°C .

- Wash 2 times with 200 μl PBS.

- Block with 150 μl of blocking buffer.

- Wash 2 times with 200 μl PBS.

C. Assay:

- Add 40 μl assay buffer/well.

- Add 40 μl human telomerase (1-1000 fmoles/40 μl in assay buffer)

- Add 10 μl compound or extract.

- Add 10 μl $[\text{}^{32}\text{P}]\alpha\text{-dGTP}$ 10x stock.

- Add 40 μl biotinylated telomerase substrate (0.1-10 pmoles/40 μl in assay buffer)

- Shake at 25°C for 15 minutes.

- Incubate additional 45 minutes at 25°C .

- Stop the reaction by washing 4 times with 200 μl PBS.

- Add 150 μl scintillation cocktail.

- Count in Topcount.

D. Controls for all assays (located on each plate):

a. Non-specific binding

b. cold dGTP at 80% inhibition.

5 2. Protocol for high throughput human telomerase subunit- RNA complex formation assay.

A. Reagents:

- Neutralite Avidin: 20 μ g/ml in PBS.

- Blocking buffer: 5% BSA, 0.5% Tween 20 in PBS; 1 hour at room temperature.

10 - Assay Buffer: 100 mM KCl, 20 mM HEPES pH 7.6, 1 mM $MgCl_2$, 1% glycerol, 0.5% NP-40, 50 mM β -mercaptoethanol, 1 mg/ml BSA, cocktail of protease inhibitors.

- ^{32}P human telomerase protein 10x stock: 10^{-8} - 10^{-6} M "cold" human telomerase subunit (p105) supplemented with 200,000-250,000 cpm of labeled human telomerase (Beckman counter). Place in the 4°C microfridge during screening.

15 - Protease inhibitor cocktail (1000X): 10 mg Trypsin Inhibitor (BMB # 109894), 10 mg Aprotinin (BMB # 236624), 25 mg Benzamidine (Sigma # B-6506), 25 mg Leupeptin (BMB # 1017128), 10 mg APMSF (BMB # 917575), and 2mM $NaVO_3$ (Sigma # S-6508) in 10 ml of PBS.

- telomerase RNA: 10^{-7} - 10^{-4} M biotinylated RNA (SEQ ID NO:6) in PBS.

20 B. Preparation of assay plates:

- Coat with 120 μ l of stock N-Avidin per well overnight at 4°C.

- Wash 2 times with 200 μ l PBS.

- Block with 150 μ l of blocking buffer.

- Wash 2 times with 200 μ l PBS.

25 C. Assay:

- Add 40 μ l assay buffer/well.

- Add 10 μ l compound or extract.

- Add 10 μ l ^{32}P -human telomerase protein (20,000-25,000 cpm/0.1-10 pmoles/well = 10^{-9} - 10^{-7} M final concentration).

30 - Shake at 25°C for 15 minutes.

- Incubate additional 45 minutes at 25°C.

- Add 40 μ l biotinylated RNA (0.1-10 pmoles/40 μ l in assay buffer)
- Incubate 1 hour at room temperature.
- Stop the reaction by washing 4 times with 200 μ l PBS.
- Add 150 μ l scintillation cocktail.
- Count in Topcount.

- 5 D. Controls for all assays (located on each plate):
- a. Non-specific binding
 - b. Soluble (non-biotinylated telomerase) at 80% inhibition.

10 All publications and patent applications cited in this specification are herein
incorporated by reference as if each individual publication or patent application were
specifically and individually indicated to be incorporated by reference. Although the
foregoing invention has been described in some detail by way of illustration and example
for purposes of clarity of understanding, it will be readily apparent to those of ordinary skill
in the art in light of the teachings of this invention that certain changes and modifications
15 may be made thereto without departing from the spirit or scope of the appended claims.

SEQUENCE LISTING

(1) GENERAL INFORMATION:

- (I) APPLICANT: Kathleen Collins
(ii) TITLE OF INVENTION: Human Telomerase
(iii) NUMBER OF SEQUENCES: 10
(iv) CORRESPONDENCE ADDRESS:
(A) ADDRESSEE: Science & Technology Law Group
(B) STREET: 268 Bush Street, Suite 3200
(C) CITY: San Francisco
(D) STATE: CA
(E) COUNTRY: USA
(F) ZIP: 94104

(v) COMPUTER READABLE FORM:

- (A) MEDIUM TYPE: Floppy disk
(B) COMPUTER: IBM PC compatible
(C) OPERATING SYSTEM: PC-DOS/MS-DOS
(D) SOFTWARE: PatentIn Release #1.0, Version #1.30

(vi) CURRENT APPLICATION DATA:

- (A) APPLICATION NUMBER:
(B) FILING DATE:
(C) CLASSIFICATION:

(viii) ATTORNEY/AGENT INFORMATION:

- (A) NAME: Osman Ph.D., Richard A
(B) REGISTRATION NUMBER: 36,627
(C) REFERENCE/DOCKET NUMBER: UCB96-055

1

5

10

WHAT IS CLAIMED IS:

1. An isolated protein comprising a telomerase protein selected from the group consisting of human telomerase protein p140, p105, p48 and p43, having molecular weights of about 140kD, about 105kD, about 48kD and about 43kD, respectively, as determined by polyacrylamide gel electrophoresis under denaturing conditions, or a human telomerase protein domain thereof having telomerase-specific activity.

2. An isolated protein according to claim 1, wherein said protein specifically binds at least one of the telomerase RNA of SEQ ID NO:6, a telomerase primer, or a nucleotide triphosphate.

3. An isolated protein according to claim 1, said protein isolated by:
lysing HeLa cells by dounce homogenization in low-salt buffer to produce cell lysates and
centrifuging said lysates supplemented with 15% glycerol at 125,000 x g for 50 minutes to obtain a first soluble fraction enriched for telomerase (S-100 fraction);

binding said S-100 fraction adjusted to 0.2 M ammonium sulfate to SP Sepharose (Pharmacia), and developing with a gradient in sodium chloride, to obtain a second soluble fraction enriched for telomerase (SP fraction);

binding said SP fraction adjusted to about 0.3-0.4 M ionic strength to Q Sepharose (Pharmacia) adjusting said SP fraction, and developing with a gradient in sodium chloride, to obtain a third soluble fraction enriched for telomerase (Q fraction); binding said Q fraction adjusted to about 0.3-0.4 M ionic strength to phosphocellulose (Whatman), and developing in sodium chloride, to obtain a fourth soluble fraction enriched for telomerase (PC fraction);

binding said PC fraction adjusted to about 0.3-0.4 M ionic strength to 2'Omethyl RNA oligonucleotide immobilized on streptavidin agarose (Sigma) and eluting with a electrophoresis sample medium comprising 5% β -mercaptoethanol and 2% Sodium Dodecyl Sulfate to obtain a fifth soluble fraction (2'Omethyl fraction);

separating said 2'Omethyl fraction by polyacrylamide gel electrophoresis under denaturing conditions to obtain a gel band at a molecular weight of about 140kD, 105kD,

48kD or 43kD having telomerase activity;

excising or eluting said gel band to obtain a human telomerase protein of a molecular weight of about 140kD, 105kD, 48kD or 43kD, respectively, as determined by polyacrylamide gel electrophoresis under denaturing conditions.

5 4. An isolated protein comprising a portion of the amino acid sequence of SEQ ID NO:1 sufficient for telomerase-specific activity.

10 5. An isolated protein according to claim 4, wherein said protein comprises a human telomerase protein domain selected from the group consisting of an RNA binding domain, a telomerase subunit binding domain, and a substrate, agonist, antagonist, chaperone or cytoskeletal binding domain.

6. A recombinant nucleic acid encoding a protein according to claim 1 or 4.

15 7. A cell comprising a nucleic acid according to claim 6.

20 8. A method of making an isolated telomerase protein, comprising steps: introducing a nucleic acid according to claim 6 into a host cell or cellular extract, incubating said host cell or extract under conditions whereby said nucleic acid is expressed as a transcript and said transcript is expressed as a translation product comprising said protein, and isolating said translation product.

9. An isolated human telomerase protein made by the method of claim 8.

25 10. An isolated human telomerase nucleic acid comprising SEQ ID NO:6, or a fragment thereof sufficient to specifically hybridize with, or amplify from a nucleic acid having the sequence defined by SEQ ID NO:6.

30 11. An isolated telomerase nucleic acid according to claim 10 comprising at least one of SEQ ID NO:6, bases 191-210, bases 245-259, bases 341-369 and bases 381-399.

12. A method of screening for an agent which modulates the binding of a human telomerase protein to a binding target, said method comprising the steps of:

incubating a mixture comprising:

an isolated protein according to claim 1,

a binding target of said protein, and

a candidate agent;

under conditions whereby, but for the presence of said agent, said protein specifically binds said binding target at a reference affinity;

detecting the binding affinity of said protein to said binding target to determine an agent-biased affinity,

wherein a difference between the agent-biased affinity and the reference affinity indicates that said agent modulates the binding of said protein to said binding target.

13. A method according to claim 12, wherein said binding target is a substrate of said protein and said reference and agent-biased binding affinity are each detected as the polymerization by said protein of a nucleic acid on said substrate.

14. An isolated somatically recombined protein receptor which specifically binds a protein according to claim 1, wherein said receptor is an antibody or a T-cell antigen receptor.

15. A method of modulating the binding of a human telomerase or telomerase protein to a human telomerase binding target, said method comprising contacting said telomerase or telomerase protein with a receptor according to claim 14.

16. A method according to claim 15, wherein said binding target is a substrate of said telomerase and said receptor inhibits the polymerization by said telomerase of a nucleic acid on said substrate.

17. A method of polymerizing a nucleic acid on a substrate, comprising contacting said substrate with a telomerase comprising a protein according to claim 1, wherein said telomerase comprises a nucleic acid template having a preselected nucleotide sequence.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US97/12296

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) :Please See Extra Sheet.

US CL :Please See Extra Sheet.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 435/194, 240.1, 252.3, 320.1, 69.1, 91.3, 172.3, 7.1; 530/350; 536/23.1, 23.2, 24.31, 24.33

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
Please See Extra Sheet.
